

Exercise 7b

NAME: Thivyaa P

ROLL NO: 240701570

Develop low-fidelity paper prototypes for a banking app and convert them into digital wireframes using Inkscape.

FRAME 1:

PAPER PROTOTYPE:

Analysis of the Banking App - Paper Prototype

This frame represents the low-fidelity paper prototype stage of the banking app design process, where core screens are sketched by hand before digitization.

1. Identify Core Features

- The essential features identified for the banking app include: login/registration, home dashboard, account balance display, fund transfers, QR code payments, and transaction history.
- Each feature maps to a distinct screen or UI section, ensuring a logical user flow.

2. Sketch Basic Layouts

- Plain paper and pencil were used to sketch the main screens of the banking app.
- Focus was placed on primary elements such as input fields, buttons, navigation menus, and labels.
- Sketches were intentionally rough to allow rapid changes without effort.

3. Iterate and Refine

- The initial sketches were reviewed for clarity and logical flow.
- Adjustments were made to ensure the layout naturally guides the user through core banking tasks.

FRAME 2:

REGISTRATION SCREEN:

Analysis of the Banking App - Registration Screen

This screen represents the first point of interaction for a new user, where personal details are entered to create a bank account profile.

1. Purpose of the Screen

- This is the user onboarding screen, where new users provide their personal information to register.

- The goal is to collect essential details in a simple, form-based layout.

2. Key Elements and UI Components

- Header (ABC Bank) - Displays the bank name prominently in a dark navy bar at the top, establishing brand identity.
- Name Field - An input box labelled 'Name' for the user's full name.
- Address Field - An input box labelled 'Address' for the user's residential address.
- Date of Birth Field - An input box labelled 'Date of birth' for identity verification.
- A/C Number Field - An input box labelled 'A/C Number' for linking an existing account.
- SUBMIT Button - A large oval button at the bottom that submits the registration form, styled in dark navy to draw attention.

3. How the Registration Screen Works

1. The user opens the app and is presented with the registration form.
2. The user fills in their Name, Address, Date of Birth, and Account Number sequentially.
3. On pressing SUBMIT, the details are confirmed and the user proceeds to the home screen.

4. Cognitive and UX Benefits

- Sequential top-to-bottom layout reduces cognitive load and matches the natural reading direction.
- Clear field labels above each input box improve accessibility and reduce errors.
- The prominent SUBMIT button provides a clear call-to-action, guiding the user to the next step.

FRAME 3:

HOME DASHBOARD:

Analysis of the Banking App - Home Dashboard

This screen is the main landing page after login, providing a quick overview of the user's account and access to core banking functions.

1. Purpose of the Screen

- This is the central hub of the banking app, displayed after a successful login.
- The goal is to present the account balance prominently and provide quick access to key features.

2. Key Elements and UI Components

- HOME Header - A bold title bar with the label 'HOME' in a dark navy background, consistent with the registration screen's branding.
- Greeting Text - 'Good Morning' personalizes the experience and acknowledges the user warmly.

- Balance Display - A highlighted purple tile showing 'Balance' and the current account amount (Rs. 101001), the most visually prominent element on the screen.
- Send Money Button - A quick-action button to initiate a fund transfer.
- Display QR Button - Generates a QR code for receiving payments, supporting contactless transactions.
- More Button - An overflow button leading to additional features not shown on the main screen.
- Bottom Navigation Bar - Contains three persistent tabs: Home, History, and Payments, ensuring easy access to core sections at all times.

3. How the Home Dashboard Works

1. The user lands on the Home screen after login and is greeted with their account balance.
2. The user can tap Send Money to initiate a transfer, Display QR to receive funds, or More to access additional options.
3. The bottom navigation bar allows the user to switch between Home, History, and Payments at any time.

4. Cognitive and UX Benefits

- The balance is the most visually prominent element, fulfilling the primary need of any banking user at a glance.
- Vertically stacked action buttons are thumb-friendly on mobile devices.
- The persistent bottom navigation bar follows standard mobile app conventions, reducing the learning curve.
- Consistent use of the navy and purple color scheme reinforces visual identity across screens
