EXPERIMENT – 1

USER INTERFACE AND DESIGN
GROCERY STORE INTERFACE USING CHUNKING AND MEMORY RECALL PRINCIPLES

Prototype Link: https://www.figma.com/proto/pigQUqs7m9LtEGrZZqj1bs/Untitled?node-id=1-2&p=f&t=I0Rw6Zc7LwMCXIwc-0&scaling=min-zoom&content-scaling=fixed&page-id=0%3A1&starting-point-node-id=1%3A2

Design Concept

This grocery store interface is designed based on the UI/UX principles of **Chunking** and **Memory Recall**. The improved version focuses on reducing visual clutter, improving readability, and organizing products into clear, memorable categories so users can navigate easily without confusion.

Screen 1 – Home Page (Category Hub)

Design Style

- Light cream background improves readability and reduces eye strain.
- A clear top navigation bar with **Home, About, Search, and Profile**.
- Large centered title **"Grocery Store"** establishes purpose.

- Category icons are placed inside a bordered container for visual grouping.

Chunking Principle

- Only **four major categories** are presented:
    - Vegetables
    - Fruits
    - Biscuits
    - Beauty Products
- This limits information and makes choices easy to remember.

Memory & Recall

- Icons act as visual cues for users to recall where items belong.
- Users remember the home screen as the **category selection point**.

Screen 2 – Vegetables Category

Design Style

- Clean layout with proper spacing between items.
- Back button for easy navigation.
- Consistent header with icon and title.

Chunking Principle

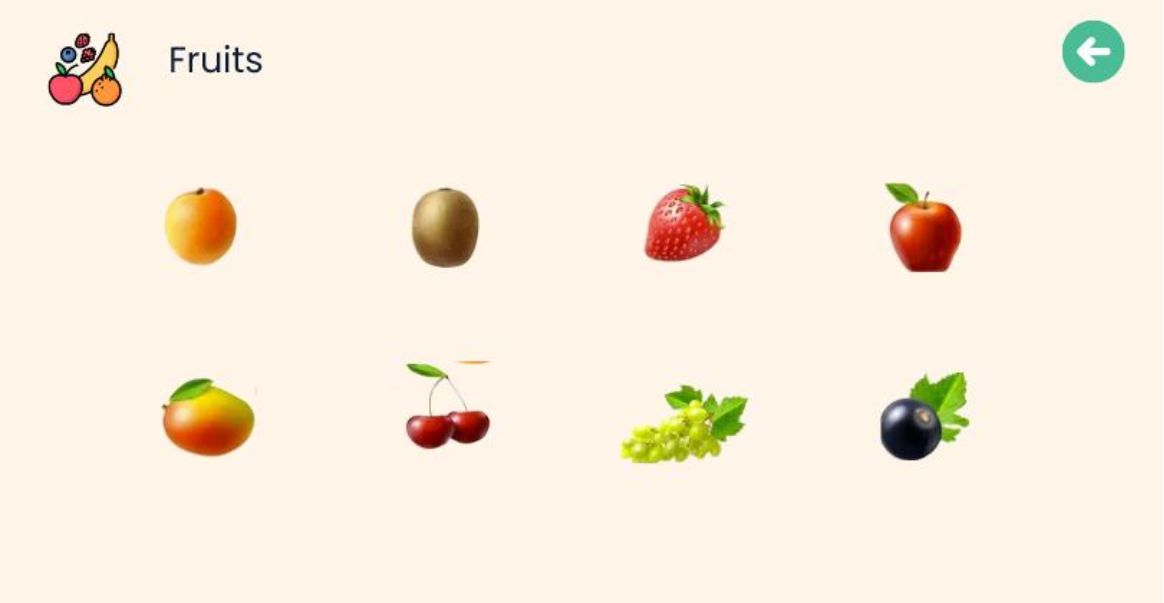
- Only vegetables are shown on this screen.

- No mixing with other grocery items.

Memory & Recall

- Familiar vegetable images (carrot, peas, cabbage, garlic, tomato) help instant recognition.
- Users mentally associate this screen with daily cooking ingredients.

Screen 3 – Fruits Category



Design Style

- Same layout structure as vegetables screen (consistency).
- Proper alignment and spacing.

Chunking Principle

- Only fruits displayed, reducing cognitive load.

Memory & Recall

- Fruits are easily recognized through colors and shapes (apple, mango, grapes, cherry).
- Users quickly recall fruit section visually.

Screen 4 – Biscuits Category

Design Style

- Packaged biscuit images displayed clearly.
- Same consistent layout pattern.

Chunking Principle

- Snacks are grouped separately from groceries.

Memory & Recall

- Recognizable product wrappers (Bourbon, Marie, etc.) act as recall triggers.

Screen 5 – Beauty Products Category

Design Style

- Beauty items grouped with consistent spacing and layout.
- Maintains visual hierarchy of other category screens.

Chunking Principle

- Personal care items are separated from food items.

Memory & Recall

- Cosmetic products are recognized instantly through shape and packaging.

Navigation Consistency

- Back arrow on every category page.
- Same header style and layout across screens.
- Predictable structure improves learning speed.

Color and Visual Appeal

- Cream background provides comfort for the eyes.

- Dark text improves readability.
- Icons and images stand out clearly without distraction.
- Minimalistic and clean look compared to earlier version.

Key UI/UX Principles Applied

Principle	Implementation
Chunking	Products divided into 4 logical categories
Memory Recall	Use of real images for recognition
Consistency	Same layout across all category screens
Minimalism	No unnecessary elements on screens
Visual Hierarchy	Title → Category → Items
Easy Navigation	Back button and top navigation bar

Conclusion

The improved grocery store interface successfully applies **chunking** by dividing products into meaningful groups and enhances **memory recall** using visual cues and consistent layouts. Compared to the earlier version, this design is cleaner, more readable, and closer to a real-world application, making navigation intuitive and user-friendly.
