

Exercise 4a

NAME: THIVYAA P ROLL NO: 240701570

Conduct task analysis for an app (e.g., food delivery) and document user flows. Create corresponding wireframes using Lucidchart.

AIM:

To understand and document the steps a user takes to complete the main tasks within a food delivery app.

Tool Link: <https://www.lucidchart.com/pages/>

PROCEDURE:

Step 1: Assigning Tasks

- Browsing Restaurants
- Searching for a Specific Food Item
- Adding a Food Item to the Cart
- Placing an Order (Checkout)

Step 2: Document User Flows FRAME 1:

BROWSING RESTAURANTS FLOW:

Analysis of the Browsing Restaurants Flow

This flow represents how a user navigates the food delivery app to browse available restaurants without a specific meal in mind. It begins at the Home Screen and ends at the Restaurant Menu page.

- Purpose of the Screen
 - This flow maps the visual exploration path a user takes from launching the app to viewing a specific restaurant's menu.
 - It tests how intuitively users can navigate location-based restaurant listings without using the search function.
- Key Elements and UI Components
 - Home Screen – User lands on the home page with featured restaurants, cuisine categories, and promotional banners displayed.
 - Acts as the starting point for all user journeys within the app.
 - Cuisine Categories – User taps on a cuisine tile (e.g., Biryani, Pizza, Chinese) to filter the restaurant list.
 - Category labels and icons help users quickly identify the type of food they want.
 - Restaurant List – User scrolls through a list of restaurants serving the selected cuisine.
 - Each card shows the restaurant name, rating, delivery time, and minimum order value.
 - Restaurant Menu – User taps on a specific restaurant to view its full menu with item names, descriptions, prices, and images.

- This is the final step before the user decides to add food items to the cart.
- End – The oval End node marks the completion of the Browsing Restaurants task flow.
- How the Browsing Flow Works
 - User opens the app and lands on the Home Screen.
 - User taps a cuisine category to filter available restaurants.
 - User scrolls through the Restaurant List to find an appealing option.
 - User taps on a restaurant to open its Menu screen.
- Cognitive and UX Benefits
 - Cuisine-based filtering reduces the number of restaurants shown at once, preventing cognitive overload.
 - The linear flow (Home to Categories to Restaurant List to Menu) matches users' natural mental model of deciding what to eat.
 - Restaurant cards with ratings and delivery time allow users to make quick decisions.
 - Each step progressively narrows the options, helping users focus without feeling overwhelmed.

FRAME 2:

SEARCHING FOR A SPECIFIC FOOD ITEM FLOW:

Analysis of the Search Flow

This flow captures the steps a user takes when they already know what food item they want to order. Instead of browsing restaurant categories, the user directly uses the search feature to locate the item quickly.

- Purpose of the Screen
 - This flow documents the goal-directed search path, which is faster than cuisine browsing for users with a specific dish in mind.
 - It evaluates how efficiently users can locate food items using keyword-based search.
- Key Elements and UI Components
 - Search – User taps the search bar or magnifying glass icon at the top of the screen.
 - This is a familiar interaction pattern found across all major food delivery apps.
 - Enter Query – User types a dish name, restaurant name, or keyword into the search input field.
 - Auto-suggestions may appear to reduce typing effort and guide users.
 - Search Results – App displays a list of food items and restaurants matching the entered query.
 - Users can apply filters (rating, price range, delivery time) to narrow results further.
 - Food Item / Restaurant Details – User taps on the desired result to view the full menu or item details.
 - Same details screen as in the Browsing flow, ensuring UI consistency.
 - End – The End node marks the completion of the Search flow.
- How the Search Flow Works
 - User taps the search bar or icon on any screen.
 - User types a dish name or keyword into the input field.
 - App returns a list of matching food items and restaurants in the Search Results screen.
 - User taps on a result to open the Food Item or Restaurant Menu page.
- Cognitive and UX Benefits
 - Direct search reduces the number of steps compared to category browsing, improving efficiency for goal-directed users.
 - Auto-suggestions lower the cognitive effort of remembering exact dish or restaurant names.
 - Displaying results in a familiar list format maintains interface consistency.
 - The flow mirrors real-world food ordering behaviour, making it immediately learnable for new users.

FRAME 3:

ADDING A FOOD ITEM TO THE CART FLOW:

Analysis of the Add to Cart Flow

This flow documents the steps a user takes to select a food item and add it to their cart. It extends the browsing or search flow by including the item customisation step before the cart action.

- Purpose of the Screen
 - This flow captures the food item selection and cart addition process, which is the core transactional step in any food delivery app.
 - It evaluates whether users can successfully customise their order (add-ons, spice level, quantity) before adding an item.
- Key Elements and UI Components
 - View Menu – User arrives at a restaurant menu through browsing or using the search bar.
 - This step represents the entry point shared with both earlier flows.
 - Food Item Details – User taps on the food item to open a detail panel with image, description, price, and customisation options.
 - The Add to Cart button is prominently placed at the bottom of this panel.
 - Customise Order (add-ons, spice level, quantity) – User selects the specific options they want before adding the item.
 - Checkboxes or radio buttons are used for add-ons and spice level; a stepper control manages quantity.
 - Add to Cart – User taps the 'Add to Cart' button to place the selected item in the cart.

- A confirmation toast or cart badge update provides immediate feedback.
- End – The End node marks the successful completion of the Add to Cart task.
- How the Add to Cart Flow Works
 - User browses or searches and taps on a food item to open its detail panel.
 - User selects the desired add-ons, spice level, and quantity from the available options.
 - User taps 'Add to Cart' to add the configured item to the cart.
 - App confirms the action and updates the cart icon badge count.
- Cognitive and UX Benefits
 - Grouping customisation options (add-ons, spice level, quantity) on a single panel reduces the number of steps before adding to cart.
 - Immediate visual feedback (badge update, toast notification) confirms the action without requiring the user to navigate away.
 - The 'Add to Cart' button is consistently positioned and styled, making it easy to locate across different menu items.
 - Keeping the customisation step before the cart action prevents unwanted additions and reduces the need for cart editing.

FRAME 4:

PLACING AN ORDER (CHECKOUT) FLOW:

Analysis of the Checkout Flow

This flow represents the most complex task in the food delivery app. It takes the user from reviewing the cart through to placing the order and receiving a confirmation, covering delivery address and payment information entry.

- Purpose of the Screen
 - This flow documents the complete order placement journey, which is the most critical and error-sensitive path in any food delivery application.
 - It evaluates how well the app guides users through multiple sequential steps without causing drop-off or order abandonment.
- Key Elements and UI Components
 - Open Cart – User taps the cart icon to review all selected items before proceeding to checkout.
 - The cart screen summarises food item names, quantities, prices, and the total amount including delivery charges.
 - Review Cart – User verifies the items in the cart and can edit quantities, remove items, or apply coupon codes.
 - A clear 'Proceed to Checkout' button guides the user to the next step.
 - Proceed to Checkout – User taps 'Checkout' to begin the order placement process.
 - The app may prompt login or guest checkout at this stage if the user is not signed in.
 - Enter Delivery Address – User provides or confirms their delivery address, including flat number, street, area, and city.
 - Saved addresses can be retrieved to reduce manual entry for returning users.
 - Enter Payment Info – User enters card details or selects a saved payment method (UPI, wallet, cash on delivery, card).
 - Security indicators (lock icons, SSL labels) reassure users during this sensitive step.
 - Place Order – User reviews the final order summary and taps 'Place Order' to confirm the purchase.
 - This is the point of no return; a confirmation dialog may appear to prevent accidental taps.
 - Order Confirmation – App displays the order ID, estimated delivery time, restaurant name, and a success message.
 - User may receive an in-app notification, email, or SMS confirmation simultaneously.
 - End – The End node marks the successful completion of the entire order placement process.
- How the Checkout Flow Works
 - User opens the cart and reviews all selected food items.
 - User taps 'Proceed to Checkout' to begin the order placement process.
 - User enters or confirms their delivery address.
 - User enters payment details or selects a saved payment method.
 - User reviews the final order summary and taps 'Place Order'.
 - App displays the Order Confirmation screen with order ID and delivery time estimate.
- Cognitive and UX Benefits
 - Breaking the checkout into sequential steps (address to payment to review) reduces cognitive load by presenting one decision at a time.
 - Progress indicators at the top of each checkout screen help users understand how many steps remain, reducing anxiety.
 - Saving delivery address and payment details for returning users dramatically shortens the checkout flow on repeat visits.
 - The Order Confirmation screen provides closure, reassuring users that their order was placed successfully and showing the expected delivery time.

Frame 4: Placing an Order (Checkout) Flow
